

SUMMARY

The Airline Reservation System is a software that tracks flight between different airport, actual selling price, capacity of a flight, and the number of days before the flight leaves when a reservation is booked. The system will track a passenger's reservation status, and each passenger's service requests, such as meal option, unaccompanied minor, bassinet wheel chair, or assist passengers who have disabilities. This system allows to add a flight, aircraft, and meal and it also allows to edit flight configuration and capacity of aircraft.
